Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual. The separation of any of these four components would have hurt TEX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.	A basic example with some filler text	1

important.		<u>)</u>
But a system cannot be successful if it is too strongly	1	,

influenced by a single person. Once the initial design is	intuenced by a single person. Once the initial design i	,

complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.
